

2018 Bergamo, Italy **Automotive**

This company operates in the automotive industry with applications of carbon ceramic brakes on high performance cars or in motor racing.

The production cycle of these particular brake discs requires the cooling and temperature control of the furnaces used to “fire” the discs themselves, which is easily understandable as temperatures reach prohibitive levels inside the furnaces.

We have perfected the system over time, in close collaboration with the customer's technicians, to provide a turnkey solution, that in complete autonomy, guarantees 24/7 cooling in total safety of the installations.

The remote control system completes the delivery, allowing to monitor its proper functioning.
