

### 2017 Parma, Italy **Automotive**

We are talking about an Italian excellence, in the production of chasses and racing and high performance cars, specialising in the processing of carbon fibre.

Dealing with this material requires a very high degree of engineering. The firing process for bodyshells and chasses requires extremely accurate temperature control in order to achieve the strength characteristics as designed.

Tempco did its part, as far as cooling and temperature control of the firing furnaces were concerned. A simple but effective and efficient system that secures the critical part of this delicate process.
