

### 2009-2015 Milan, Italy **Renewable Energies**

Biogas cogeneration plants require gas dehumidification treatment before they can feed endothermic engines.

Biogas that still contains high levels of moisture can cause irreparable damage to expensive energy production units.

We have been supplying shell and tube heat exchangers for these applications for years, with a range from a few tens of cubic metres per hour up to about 1500 m<sup>3</sup>/h.

In this specific case, in addition to the standard systems for which we have already procured dozens of supplies, it was a matter of supplying a series of exchangers for flow rates of 600 to 1000 m<sup>3</sup>/h for the US market.
