

2009-2015 Montaigu-Vendée, France **Renewable Energies**

A French company that has been designing, building and servicing biogas purification plants since 2008.

In order to feed endothermic engines, the biogas from cogeneration plants must undergo dehumidification treatment. Otherwise, biogas that still contains high levels of moisture can cause irreparable damage to expensive energy production units.

We have been supplying shell and tube heat exchangers for these applications for years, with a range from a few tens of cubic metres per hour up to about 1500 m³/h.

Depending on the pollutants in the biogas, either a full stainless steel or mixed iron-stainless steel construction can be selected.
