

### 2009-2018 Como, Italy **Renewable Energies**

Biogas for cogeneration plants requires a series of treatments before it can feed endothermic engines.

This company, which specialises in gas desulphurisation and refining treatments, has used our experience in biogas dehumidification for many years.

We supply shell and tube heat exchangers for these applications, with a range from a few tens of cubic metres per hour up to about 1500 m<sup>3</sup>/h. Full stainless steel or mixed iron-stainless steel construction, are selectable according to the concentration of pollutants in the biogas.
